Regression Models Course Project: MT Cars Analysis

Lei Fan 1/29/2020

Overview

The following analysis studies the mtcars dataset, explores the relationship between the miles-per-gallon (MPG) and various other factors of the cars in the dataset, and attempts to answer the following two questions:

- "Is an automatic or manual transmission better for MPG?"
- "Quantify the MPG difference between automatic and manual transmissions."

Exploratory Analysis

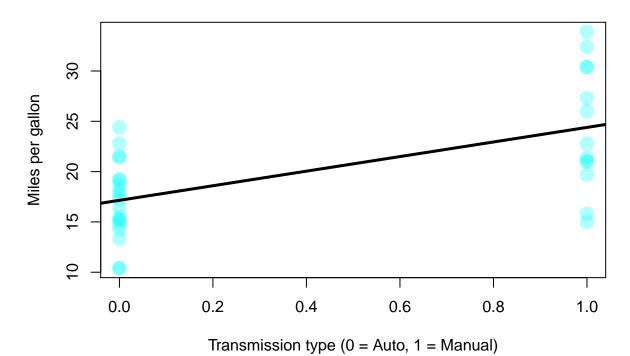

Looking at the average MPG value for cars with automatic transmission vs. manual transmission, it appears that we can reject the null hypothesis (that the two have the same average MPG) in favor of the alternative, that cars with automatic transmission have a lower average MPG than cars with manual transmission:

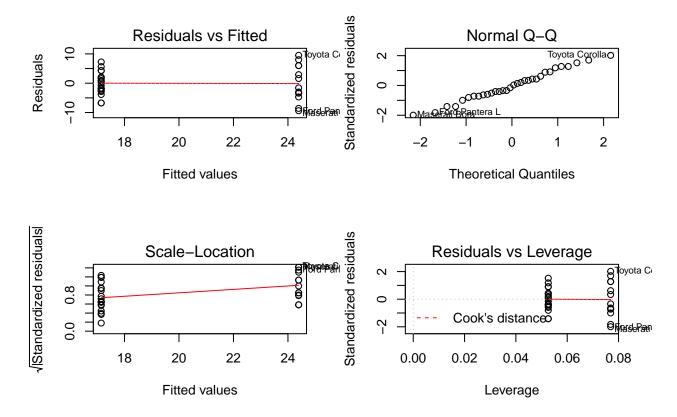

If only the transmission type was taken into account, it appears that, on average, cars with manual transmission get \sim 7.2 more miles per gallon than cars with automatic transmission (see slope of the am regressor below):

```
##
## Call:
## lm(formula = mpg ~ am, data = mtcars)
##

## F-statistic: 16.86 on 1 and 30 DF, p-value: 0.000285
```

Cars' transmission type vs. MPG

Although the am factor was clearly significant, and there's nothing particularly wrong with the model (no heteroscedasticity observed, the variance was roughly normally distributed, etc.), with an adjusted R-squared value of only 0.3385, this is a rather poor model.

Multiple Regressors

We will attempt to find other regressors that may also contribute to determining MPG:

```
cor(mtcars$mpg, mtcars)
##
                   cyl
                             disp
                                           hp
                                                    drat
                                                                         qsec
##
   [1,]
            -0.852162
                       -0.8475514 -0.7761684 0.6811719 -0.8676594 0.418684
##
               vs
                                   gear
                                              carb
  [1,] 0.6640389 0.5998324 0.4802848 -0.5509251
```

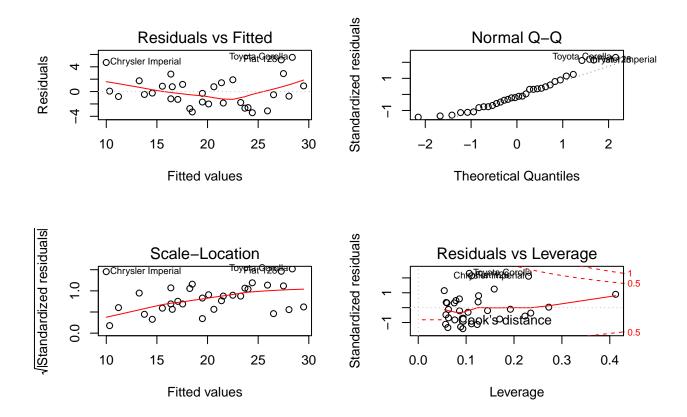

As we can see, cyl, disp, hp, and wt are all quite highly correlated with the MPG value. A model that includes those 4 regressors, as well as am, should perform better than just am alone. Let's see it, along with the VIFs, since we have so many regressors, some of which, intuitively, seem correlated (e.g. cyl and hp).

```
##
## Call:
## lm(formula = mpg ~ am + cyl + disp + hp + wt, data = mtcars)
##
## Residuals:
```

```
##
               1Q Median
                               3Q

##
        am
                cyl
                        disp
                                   hp
## 1.597831 2.685043 3.225123 2.121758 2.465654
```

The adjusted R-squared value is high (~83% of variation explained by model), but too many regressors are correlated with the others (especially cyl and disp). Let's try removing them from the model and look at the VIFs again.

```

## 1.507011 1.942894 1.445034
```

The model is pretty good at explaining the MPG (~82% variation explained) and has no significant issues (no heteroscedasticity observed, the variance was roughly normally distributed aside from a couple of outliers, no overly large VIFs). How does it compare to some other models?

```

                                           0.812059
                            0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

As the ANOVA result shows, the 3rd model (only am, wt and hp) is perhaps our fit; the other models cannot justify their inclusion of additional regressors at a loss of our previous DFs. Therefore we conclude that cars with manual transmission gets ~2 more miles per gallon than cars with automatic transmission.
